create_gaussian_kernel

gaussian_filter

main:

Prompt user for image filename
'filename = input(...)'
Set image path to 'ref_images/filename'
(with fallback to local path)
Load image and convert to grayscale
'gray_img' as 'uint8' NumPy array
Set 'sigma = 1.0'
Call 'gaussian_filter(gray_img, sigma)'
Construct output filename
(e.g., '_smooth.png')
Convert NumPy array back to PIL image,
save file, and display result
